HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION

Allowable Subject Matter

1. Claims 1-3 and 6-35 are allowed.

Regarding Claims 1 and 20, Smith *et al.*, U.S. Patent No. 6,219,409, discloses a premises gateway for allowing various devices, each connected to a different telephone jack on the subscriber's premises, but all connected to a single telephone line, to be treated differently; said premises gateway has interchangeable network interface cards as well as cards for communicating with the different nodes on a subscriber's premises (Abstract, Column 3 Lines 27-58, Figs. 1 and 9). With reference to Figure 9, the Network Interface Cards 175 collectively constitute a network interface device that is in communication with the telephone network, and the CPU Board 186 and PNI Communication Cards 187 collectively constitute a base unit. The CPU board executes an algorithm according to which it either causes an incoming telephone call to be delivered to a device at a specific telephone wall jack, or prevents said incoming telephone call from being delivered to the device at said specific telephone wall jack (Column 3 Lines 56-65, Column 9 Lines 6-47, Column 10 Lines 15-18 and 39-54, Column 15 Line 61 to Column 16 Line 32, Figs. 3-5).

Smith *et al.* does not expressly disclose the presence of an extension control device in communication with the base unit, whereby said extension control device is used to enter and modify one or more algorithms according to which said base unit handles incoming telephone calls, said extension control

device receiving power from a current on a telephone line so as to accumulate a charge that generates a ring event.

McKendry *et al.*, U.S. Patent No. 6,021,176, discloses method for the operation of a programmable personal call manager (PCAM) that selectively routes incoming telephone calls to any combination of extensions on the owner's premises (Abstract, Column 4 Lines 43-50, Figs. 1-3); the PCAM therefore acts as a base unit. DTMF keypads on any of the telephones connected to the PCAM, or a graphical user interface of a computer connected to the PCAM, may be used to configure the call handling algorithms used by said PCAM (Column 11 Lines 21-55, Fig. 1); the telephones and the computer therefore act as extension control devices through which the owner may interface with the PCAM.

Neither Smith *et al.* nor McKendry *et al.* expressly discloses the inclusion of an extension control device that receives power from a current on a telephone line so as to accumulate a charge that generates a ring event.

Henderson, U.S. Patent No. 4,107,476, discloses a circuit that controls the on-off ringing of a line powered tone ringer in a telephone, said circuit comprising a capacitor (C2 of Fig. 1) that, when charged to a certain voltage, allows a 35 Volt RMS, 18 Hz signal, but not a 300 Volt peak, 12 Hz transient, to activate the tone ringer (Abstract, Column 2 Line 31 to Column 3 Line 3, Fig. 1). However, this circuit exists within a telephone set, and not within any sort of extension device, nor is it disclosed that the invention is used in the context of a

telephone jack connected to the outside telephone network via a base unit and a network interface device.

Guerra, Jr., U.S. Patent No. 5,233,649, discloses a telephone ringing module that locally generates ring signals for multiple subscriber telephones (Abstract, Fig. 1). Trigger signals from the local ring generator are fed through capacitors (which provide low resistance to the AC component and an open circuit to the DC component of the signal), and then to a generator sensing circuit; a ring is generated by decrease in resistance across the local ring generator's leads that causes said local ring generator to overdrive (Column 2 Lines 50-68, Column 5 Lines 48-68). However, the ring signal is not directly created by a buildup of charge on any of the capacitors.

No prior art reference was found that discloses an extension control device, in communication with a telephone network via a base unit, that, using current from a telephone line, builds up a charge that generates a ring event on said telephone line.

Claims 2-3 and 6-19 depend on Claim 1, and Claims 21-35 depend on Claim 20. Therefore, Claims 2-3, 6-19, and 21-35 are allowable over the prior art.
